Part 2: Retrospective

A Letter to Week 1 Melih

When you first started this internship, your vision was very clear: what I want to achieve is to enter professional life not just with the things I learned in classes, but with the projects I built myself and the knowledge I gained. You knew that not staying within the boundaries of the school and trying to improve yourself at every opportunity was the only way to become a true engineer. My biggest goal in participating in this internship was to add something to myself, learn new things, and build projects. Looking back, I have now achieved all of this. But this is not an end; I will continue learning without stopping.

Throughout this process, you didn't just learn new technologies; your entire workflow fundamentally changed. Previously, you might have jumped straight into the editor. But now, when I am going to develop a project with artificial intelligence, I will not dive headfirst into a pile of code anymore. I learned that I must first clarify the framework of the project and then move on to coding, which is the easiest part. Coding is no longer the main struggle; it's simply the execution of a well-planned architecture.

So, what is next? Next up is acquiring knowledge in different training programs and developing projects that will be used in real life. The focus will be on building actual products that people can interact with, not just local scripts sitting on my computer.

Here are the top 3 core skills I am taking away from this experience to apply to every future project:

- **Do not trust AI blindly:** It is a fantastic assistant, but you are the engineer. Not every confident output is the correct solution for your specific system.
- **Know exactly where to let go of control:** The greatest advantage is learning when to hand over repetitive tasks to the AI, while firmly keeping your hands on the steering wheel for architectural decisions.
- **Check the outputs you receive:** Validate every piece of generated code and logic through your own engineering filter before integrating it into your system.

Total Hours Logged: 30 hours
